

# John Lynch

---

John Lynch is an environmental scientist with an interest in the impacts of agricultural production. His current work at the University of Oxford focuses on agricultural greenhouse gas emissions, and especially those associated with livestock. Prior to this, he explored measures of farm sustainability at Teagasc (the Irish Agriculture and Food Development Authority) and the University of Nottingham. He is interested in using physical climate models and alternative greenhouse gas emission metrics to explore the impacts of different dietary and agricultural scenarios, including novel food products and changes in production methods.
